Chapter 1

Preliminaries

In this section we define skew braces and list some of their main properties [GV17].

1.1 Definition and examples

A skew brace is a triple $(A,+,\circ)$, where (A,+) and (A,\circ) are two (not necessarily abelian) groups such that the compatibility $a \circ (b+c) = a \circ b - a + a \circ c$ holds for all $a,b,c \in A$. Ones proves that the map $\lambda: (A,\circ) \to \operatorname{Aut}(A,+)$, $a \mapsto \lambda_a(b)$, $\lambda_a(b) = -a + a \circ b$, is a group homomorphism. Notation: For $a,b \in A$, we write $a*b = \lambda_a(b) - b$.

1.1.1 IsSkewbrace (for IsAttributeStoringRep)

1.1.2 Skewbrace (for IsList)

```
> Skewbrace(list) (operation)
```

Returns: a skew brace

The argument list is a list of pairs of elements in a group. By Proposition 5.11 of [GV17], skew braces over an abelian group A are equivalent to pairs (G,π) , where G is a group and $\pi:G\to A$ is a bijective 1-cocycle, a finite skew brace can be constructed from the set $\{(a_j,g_j):1\leq j\leq n\}$, where $G=\{g_1,\ldots,g_n\}$ and $A=\{a_1,\ldots,a_n\}$ are permutation groups. This function is used to construct skew braces.

1.1.3 SmallSkewbrace (for IsInt, IsInt)

```
▷ SmallSkewbrace(n, k) (operation)

Returns: a skew brace
```

The function returns the k-th skew brace from the database of skew braces of order n.

```
gap> SmallSkewbrace(8,3);
<br/>
<br/
```

1.1.4 TrivialBrace (for IsGroup)

▷ TrivialBrace(abelian_group)

(operation)

Returns: a brace

This function returns the trivial brace over the abelian group abelian_group. Here abelian_group should be an abelian group!

```
gap> TrivialBrace(CyclicGroup(IsPermGroup, 5));
<brace of size 5>
```

1.1.5 TrivialSkewbrace (for IsGroup)

▷ TrivialSkewbrace(group)

(operation)

Returns: a skew brace

This function returns the trivial skew brace over group.

```
gap> TrivialSkewbrace(DihedralGroup(10));
<skew brace of size 10>
```

1.1.6 SmallBrace (for IsInt, IsInt)

 \triangleright SmallBrace(n, k)

(operation)

Returns: a brace of abelian type

The function returns the k-th brace (of abelian type) from the database of braces of order n.

1.1.7 IdSkewbrace (for IsSkewbrace)

▷ IdSkewbrace(obj)

(attribute)

Returns: a list

The function returns [n, k] if the skew brace obj is isomorphic to SmallSkewbrace (n,k).

```
gap> IdSkewbrace(SmallSkewbrace(8,5));
[ 8, 5 ]
```

1.1.8 AutomorphismGroup (for IsSkewbrace)

▷ AutomorphismGroup(obj)

(attribute)

Returns: a list

The function computes the automorphism group of a skew brace.

```
gap> br := SmallSkewbrace(8,20);;
gap> AutomorphismGroup(br);
<group with 8 generators>
gap> StructureDescription(last);
"D8"
Example
```

```
gap> br := SmallSkewbrace(8,25);;
gap> aut := AutomorphismGroup(br);;
gap> f := Random(aut);;
gap> x := Random(br);;
gap> ImageElm(f, x) in br;
true
```

1.1.9 IdBrace (for IsSkewbrace)

```
    □ IdBrace(obj) (attribute)
```

Returns: a list

The function returns [n, k] if the brace of abelian type obj is isomorphic to SmallBrace(n,k).

```
gap> IdBrace(SmallBrace(8,5));
[ 8, 5 ]
```

1.1.10 IsomorphismSkewbraces

▷ IsomorphismSkewbraces(obj1, obj2)

(function)

Returns: an isomorphism of skew braces if *obj1* and *obj2* are isomorphic and *fai1* otherwise. If A and B are skew braces, a skew brace homomorphism is a map $f: A \rightarrow B$ such that

$$f(a+b) = f(a) + f(b)$$
 $f(a \circ b) = f(a) \circ f(b)$

hold for all $a,b \in A$. A skew brace isomorphism is a bijective skew brace homomorphism. IsomorphismSkewbraces first computes all injective homomorphisms from (A,+) to (B,+) and then tries to find one f such that $f(a \circ b) = f(a) \circ f(b)$ for all $a,b \in A$.

1.1.11 DirectProductSkewbraces (for IsSkewbrace, IsSkewbrace)

▷ DirectProductSkewbraces(obj1, obj2)

(operation)

Returns: the direct product of obj1 and obj2

```
gap> br1 := SmallBrace(8,18);;
gap> br2 := SmallBrace(12,2);;
gap> br := DirectProductSkewbraces(br1,br2);;
gap> IsLeftNilpotent(br);
false
gap> IsRightNilpotent(br);
false
gap> IsSolvable(br);
true
```

1.1.12 DirectProductOp (for IsList, IsSkewbrace)

```
▷ DirectProductOp(arg1, arg2)
```

(operation)

1.1.13 IsTwoSided (for IsSkewbrace)

▷ IsTwoSided(obj)

(property)

Returns: true if the skew brace is two sided, false otherwise

A skew brace A is said to be two-sided if $(a+b) \circ c = a \circ c - c + b \circ c$ holds for all $a,b,c \in A$.

```
gap> IsTwoSided(SmallSkewbrace(8,2));
false
gap> IsTwoSided(SmallSkewbrace(8,4));
true
```

1.1.14 IsAutomorphismGroupOfSkewbrace (for IsAutomorphismGroup)

▷ IsAutomorphismGroupOfSkewbrace(obj)

(property)

Returns: true if the group is the automorphism group of a skew braces, false otherwise

```
gap> br := SmallSkewbrace(8,25);;
gap> aut := AutomorphismGroup(br);;
gap> Order(aut);
4
gap> IsAutomorphismGroupOfSkewbrace(aut);
true
```

1.1.15 IsClassical (for IsSkewbrace)

▷ IsClassical(obj)

(property)

Returns: true if the skew brace is of abelian type, false otherwise

Let \mathscr{X} be a property of groups. A skew brace A is said to be of \mathscr{X} -type if its additive group belongs to \mathscr{X} . In particular, skew braces of abelian type are those skew braces with abelian additive group. Such skew braces were introduced by Rump in [Rum07].

1.1.16 IsOfAbelianType (for IsSkewbrace)

```
▷ IsOfAbelianType(arg)
```

(property)

Returns: true or false

1.1.17 IsBiSkewbrace (for IsSkewbrace)

```
\triangleright IsBiSkewbrace(obj)
```

(property)

Returns: true if the skew brace is a bi-skew brace, false otherwise

A skew brace $(A, +, \circ)$ is said to be a bi-skew brace if $(A, \circ, +)$ is a skew brace

```
gap> Number([1..NrSmallSkewbraces(8)], k->IsBiSkewbrace(SmallSkewbrace(8,k)));
39
```

1.1.18 IsOfNilpotentType (for IsSkewbrace)

▷ IsOfNilpotentType(obj)

(property)

Returns: true if the skew brace is of nilpotent type, false otherwise

Let $\mathscr X$ be a property of groups. A skew brace A is said to be of $\mathscr X$ -type if its additive group belongs to $\mathscr X$. In particular, skew braces of nilpotent type are those skew braces with nilpotent additive group.

1.1.19 IsTrivialSkewbrace (for IsSkewbrace)

▷ IsTrivialSkewbrace(obj)

(property)

Returns: true if the skew brace is trivial, false otherwise

The function returns true if the skew brace A is trivial, i.e., $a \circ b = a + b$ for all $a, b \in A$. WARN-ING: The property IsTrivial applied to a skew brace will return true if and only if the skew brace has only one element.

```
gap> br := SmallSkewbrace(9,1);;
gap> IsTrivialSkewbrace(br);
true
gap> IsTrivial(br);
false
```

1.1.20 Skewbrace2YB (for IsSkewbrace)

▷ Skewbrace2YB(obj)

(attribute)

Returns: the set-theoretic solution associated with the skew brace obj

If *A* is a skew brace, the map $r_A: A \times A \rightarrow A \times A$

$$r_A(a,b) = (\lambda_a(b), \lambda_a(b)' \circ a \circ b)$$

is a non-degenerate set-theoretic solution of the Yang--Baxter equation. Furthermore, r_A is involutive if and only if A is of abelian type (i.e., the additive group of A is abelian).

```
gap> Skewbrace2YB(TrivialBrace(CyclicGroup(6)));
<A set-theoretical solution of size 6>
```

1.1.21 Brace2YB (for IsSkewbrace)

▷ Brace2YB(arg) (attribute)

1.1.22 SkewbraceSubset2YB (for IsSkewbrace, IsCollection)

▷ SkewbraceSubset2YB(obj)

(operation)

Returns: the set-theoretic solution associated with a given subset of a skew brace

```
gap> br := TrivialSkewbrace(SymmetricGroup(3));;
gap> AsList(br);
[ <()>, <(2,3)>, <(1,2)>, <(1,2,3)>, <(1,3,2)>, <(1,3)> ]
gap> SkewbraceSubset2YB(br, last{[4,5]});
<A set-theoretical solution of size 2>
```

1.1.23 SemidirectProduct (for IsSkewbrace, IsSkewbrace, IsGeneralMapping)

▷ SemidirectProduct(A, B, s)

(operation)

Returns: the semidirect product of skew braces

Let A and B be two skew braces and σ be a skew brace action of B on A, this is a group homomorphism $\sigma: (B, \circ) \to Aut_{Br}(A)$ from the multiplicative group of B to the skew brace automorphism of A. The semidirect product of A and B with with respect to σ is the skew brace $A \rtimes_{\sigma} B$ with operations

```
(a_1,b_1)+(a_2,b_2)=(a_1+a_2,b_1+b_2), (a_1,b_1)\circ(b_2,b_2)=(a_1\circ\sigma(b_1)(a_2),b_1\circ b_2)
```

```
gap> A := SmallSkewbrace(4,2);;
gap> B := SmallSkewbrace(3,1);;
gap> s := SkewbraceActions(B,A);;
gap> Size(s);
1
gap> IdSkewbrace(SemidirectProduct(A,B,s[1]));
[ 12, 11 ]
gap> IdSkewbrace(DirectProduct(A,B));
[ 12, 11 ]
```

1.1.24 UnderlyingAdditiveGroup (for IsSkewbrace)

▷ UnderlyingAdditiveGroup(A)

(attribute)

Returns: the underlying multiplicative group of the skew brace

```
gap> br := SmallBrace(4,2);;
gap> G:=UnderlyingMultiplicativeGroup(br);;
gap> StructureDescription(G);
"C2 x C2"
```

1.1.25 UnderlyingMultiplicativeGroup (for IsSkewbrace)

▷ UnderlyingMultiplicativeGroup(A)

(attribute)

Returns: the underlying additive group of the skew brace

```
gap> br := SmallSkewbrace(6,2);;
gap> G:=UnderlyingAdditiveGroup(br);;
gap> IsAbelian(G);
false
```

Chapter 2

Algebraic Properties of Braces

2.1 Braces and Radical Rings

2.1.1 AdditiveGroupOfRing (for IsRing)

AdditiveGroupOfRing(ring)

(attribute)

Returns: a group

This function returns a permutation representation of the additive group of the given ring.

```
gap> rg := SmallRing(8,10);;
gap> StructureDescription(AdditiveGroupOfRing(rg));
"C4 x C2"
```

2.1.2 IsJacobsonRadical (for IsRing)

▷ IsJacobsonRadical(ring)

(attribute)

Returns: true if the ring is radical and false otherwise. This function checks whether a ring is Jacobson radical.

```
gap> rg := SmallRing(8,11);;
gap> IsJacobsonRadical(rg);
true
gap> rg := SmallRing(8,20);;
gap> IsJacobsonRadical(rg);
false
Example
```

2.2 Braces and Yang-Baxter Equation

2.2.1 Table2YB (for IsList)

▷ Table2YB(table) (operation)

Returns: the solution given by the table

Given the table with r(x, y) in the position (x, y) find the corresponding r

```
gap> 1 := Table(SmallIYB(4,13));;
gap> t := Table2YB(1);;
Example
```

```
gap> IdCycleSet(YB2CycleSet(t));
[ 4, 13 ]
```

2.2.2 Evaluate (for IsYB, IsList)

▷ Evaluate(obj, pair)

(operation)

Returns: a pair of two integers

Given the pair (x, y) this function returns r(x, y).

2.2.3 LyubashenkoYB (for IsInt, IsPerm, IsPerm)

▷ LyubashenkoYB(size, f, g)

(operation)

Returns: a permutation solution to the YBE

Finite Lyubashenko (or permutation) solutions are defined as follows: Let $X = \{1, ..., n\}$ and $f, g: X \to X$ be bijective functions such that fg = gf. Then (X, r), where r(x, y) = (f(y), g(x)), is a set-theoretic solution to the YBE.

```
Example

gap> yb := LyubashenkoYB(4, (1,2),(3,4));

<A set-theoretical solution of size 4>

gap> Permutations(last);

[[(1,2), (1,2), (1,2), (1,2)], [(3,4), (3,4), (3,4), (3,4)]]
```

2.2.4 IsIndecomposable (for IsYB)

▷ IsIndecomposable(X)

(property)

Returns: true if the involutive solutions is indecomposable

2.2.5 Table (for IsYB)

▷ Table(obj)

(attribute)

Returns: a table with the image of the solution The table shows the value of r(x, y) for each (x, y)

```
Example

gap> yb := SmallIYB(3,2);;

gap> Table(yb);

[[[1,1],[2,1],[3,2]],[[1,2],[2,2],[3,1]],[[2,3],[1,3],[3,
```

2.2.6 DehornoyClass (for IsYB)

▷ DehornoyClass(obj)

(attribute)

Returns: The class of an involutive solution

```
gap> cs := SmallCycleSet(4,13);;
gap> yb := CycleSet2YB(cs);;
gap> DehornoyClass(yb);
2
gap> cs := SmallCycleSet(4,19);;
gap> yb := CycleSet2YB(cs);;
gap> DehornoyClass(yb);
4
```

2.2.7 DehornoyRepresentationOfStructureGroup (for IsYB, IsObject)

▷ DehornoyRepresentationOfStructureGroup(obj, variable)

(operation)

Returns: A faithful linear representation of the structure group of obj

```
_ Example _
gap> cs := SmallCycleSet(4,13);;
gap> yb := CycleSet2YB(cs);;
gap> Permutations(yb);
[ [ (3,4), (1,3,2,4), (1,4,2,3), (1,2) ],
  [(2,4), (1,4,3,2), (1,2,3,4), (1,3)]
gap> field := FunctionField(Rationals, 1);;
gap> q := IndeterminatesOfFunctionField(field)[1];;
gap> G := DehornoyRepresentationOfStructureGroup(yb, q);;
gap> x1 := G.1;;
gap> x2 := G.2;;
gap> x3 := G.3;;
gap > x4 := G.4;;
gap> x1*x2=x2*x4;
true
gap > x1*x3=x4*x2;
gap> x1*x4=x3*x3;
true
gap > x2*x1=x3*x4;
gap> x2*x2=x4*x1;
true
gap> x3*x1=x4*x3;
true
```

2.2.8 IdYB (for IsYB)

 \triangleright IdYB(obj) (attribute)

Returns: the identification number of obj

```
gap> cs := SmallCycleSet(5,10);;
gap> IdCycleSet(cs);
```

```
[ 5, 10 ]
gap> cs := SmallCycleSet(4,3);;
gap> yb := CycleSet2YB(cs);;
gap> IdYB(yb);
[ 4, 3 ]
```

2.2.9 LinearRepresentationOfStructureGroup (for IsYB)

▷ LinearRepresentationOfStructureGroup(obj)

(attribute)

Returns: the permutation brace of the involutive solution of *obj* a linear representation of the structure group of a finite involutive solution

```
gap> yb := SmallIYB(5,86);;
gap> IdBrace(IYBBrace(yb));
[ 6, 2 ]
```

Chapter 3

YangBaxter automatic generated documentation

3.1 YangBaxter automatic generated documentation of properties

3.1.1 IsIndecomposable (for IsCycleSet)

▷ IsIndecomposable(arg)

(property)

Returns: true if the cycle set is indecomposable

Let *X* be a cycle set. We say that *X* is indecomposable if the group $\mathscr{G}(X) = \langle \varphi_x : x \in X \rangle$ acts transitively on *X*.

Chapter 4

Ideals and left ideals

In this section we describe several functions related to ideals and left ideals of skew braces. References: [GV17] and [SV18].

4.1 Left ideals

An left ideal I of a skew brace A is a subgroup I of the additive group of A such that $\lambda_a(I) \subseteq I$ for all $a \in A$.

4.1.1 LeftIdeals (for IsSkewbrace)

```
\triangleright LeftIdeals(obj) (attribute)
```

Returns: a list with the left ideals of the skew brace obj

4.1.2 StrongLeftIdeals (for IsSkewbrace)

```
ightharpoonup StrongLeftIdeals(obj) (attribution)
```

Returns: a list with the left ideals of the skew brace obj that are normal in the additive group of A

```
gap> br := SmallSkewbrace(24,12);

<skew brace of size 24>

gap> strong_left_ideals := StrongLeftIdeals(br);

[ <left ideal in <skew brace of size 24>, (size 24)>,

<left ideal in <skew brace of size 24>, (size 12)>,

<left ideal in <skew brace of size 24>, (size 6)>,

<left ideal in <skew brace of size 24>, (size 4)>,

<left ideal in <skew brace of size 24>, (size 2)>,

<left ideal in <skew brace of size 24>, (size 3)>,

<left ideal in <skew brace of size 24>, (size 1)> ]
```

4.1.3 IsLeftIdeal (for IsSkewbrace, IsCollection)

 \triangleright IsLeftIdeal(obj) (operation)

Returns: true if the subset is a left ideal of obj

```
_{-} Example _{-}
gap> br := SmallBrace(8,4);
<brace of size 8>
gap> leftideals := LeftIdeals(br);
[ <left ideal in <brace of size 8>, (size 1)>, <left ideal in <brace of size 8>, (size 2)>,
<left ideal in <brace of size 8>, (size 4)>,
<left ideal in <brace of size 8>, (size 8)> ]
gap> List(leftideals, x->IsLeftIdeal(br, x));
[ true, true, true ]
gap> List(leftideals, IdBrace);
[[1, 1], [2, 1], [4, 1], [8, 4]]
```

4.2 **Ideals**

An ideal I of a skew brace A is a normal subgroup I of the additive group of A such that $\lambda_a(I) \subseteq I$ and $a \circ I = I \circ a$ for all $a \in A$.

4.2.1 IsIdeal (for IsSkewbrace, IsCollection)

▷ IsIdeal(obj, subset)

(operation) Returns: true if the subset is a left ideal of obj

```
_{-} Example
gap> br := SmallBrace(8,4);
<brace of size 8>
gap> leftideals := LeftIdeals(br);
[ <left ideal in <brace of size 8>, (size 1)>,
<left ideal in <brace of size 8>, (size 2)>,
<left ideal in <brace of size 8>, (size 4)>,
<left ideal in <brace of size 8>, (size 8)> ]
gap> List(leftideals, x->IsLeftIdeal(br, x));
[ true, true, true, true ]
gap> List(leftideals, IdBrace);
```

4.2.2 Ideals (for IsSkewbrace)

▷ Ideals(obj) (attribute)

Returns: a list with the ideals of the skew brace obj

[[1, 1], [2, 1], [4, 1], [8, 4]]

4.2.3 AsIdeal (for IsSkewbrace, IsCollection)

```
▷ AsIdeal(arg1, arg2)
                                                                                        (operation)
```

4.2.4 IdealGeneratedBy (for IsSkewbrace, IsCollection)

```
▷ IdealGeneratedBy(obj, subset)
                                                                                   (operation)
```

Returns: the ideal of obj generated by the given subset

The ideal of a skew brace A generated by a subset X is the intersection of all the ideals of A containing X.

4.2.5 IntersectionOfTwoIdeals (for IsSkewbrace and IsIdealInParent, IsSkewbrace and IsIdealInParent)

▷ IntersectionOfTwoIdeals(ideal1, ideal2)

(operation)

Returns: the intersection of ideal1 and ideal2

```
gap> br := SmallSkewbrace(6,6);;
gap> Ideals(br);;
gap> IntersectionOfTwoIdeals(last[2],last[3]);
<ideal in <brace of size 6>, (size 1)>
```

4.2.6 SumOfTwoIdeals (for IsSkewbrace and IsIdealInParent, IsSkewbrace and IsIdealInParent)

▷ SumOfTwoIdeals(ideal1, ideal2)

(operation)

Returns: the sum of ideal1 and ideal2

```
gap> br := SmallSkewbrace(6,6);;
gap> Ideals(br);;
gap> SumOfTwoIdeals(last[2],last[3]);
<ideal in <brace of size 6>, (size 6)>
```

4.3 Sequences (left) ideals

4.3.1 LeftSeries (for IsSkewbrace)

```
▷ LeftSeries(obj)
```

(attribute)

Returns: the left ideals of the left series of *obj*

The left series of a skew brace A is defined recursively as $A^1 = A$ and $A^{n+1} = A * A^n$ for $n \ge 1$, where $a * b = \lambda_a(b) - b$. Each A^n is a left ideal.

4.3.2 RightSeries (for IsSkewbrace)

▷ RightSeries(obj)

(attribute)

Returns: the ideals of the right series of *obj*

The right series of a skew brace 0A is defined recursively as $A^{(1)} = A$ and $A^{(n+1)} = A * A^{(n)}$ for $n \ge 1$, where $a * b = \lambda_a(b) - b$

4.3.3 IsLeftNilpotent (for IsSkewbrace)

▷ IsLeftNilpotent(obj)

(property)

Returns: true if the skew brace obj is left nilpotent.

A skew brace A is said to be left nilpotent if there exists $n \ge 1$ such that $A^n = 0$.

```
gap> IsLeftNilpotent(SmallBrace(8,18));
true
gap> IsLeftNilpotent(SmallBrace(12,2));
false
```

4.3.4 IsSimpleSkewbrace (for IsSkewbrace)

▷ IsSimpleSkewbrace(obj)

(property)

Returns: true if the skew brace obj is simple.

A skew brace A is said to be simple if $\{0\}$ and A are its only ideals.

```
gap> IsSimple(SmallSkewbrace(12,22));
true
gap> IsSimple(SmallSkewbrace(12,21));
false
```

4.3.5 IsRightNilpotent (for IsSkewbrace)

▷ IsRightNilpotent(obj)

(property)

Returns: true if the skew brace obj is right nilpotent.

A skew brace *A* is said to be right nilpotent if there exists $n \ge 1$ such that $A^{(n)} = 0$.

```
gap> IsRightNilpotent(SmallBrace(8,18));
false
gap> IsRightNilpotent(SmallBrace(12,2));
true
```

4.3.6 LeftNilpotentIdeals (for IsSkewbrace)

▷ LeftNilpotentIdeals(obj)

(attribute)

Returns: the list of right or left nilpotent ideals of obj

An ideal *I* of a skew brace *A* is said to be left if it is left nilpotent as a skew brace.

4.3.7 RightNilpotentIdeals (for IsSkewbrace)

▷ RightNilpotentIdeals(obj)

(attribute)

Returns: the list of right or left nilpotent ideals of obj

An ideal *I* of a skew brace *A* is said to be right nilpotent if An ideal *I* of a skew brace *A* is said to be left if it is right nilpotent as a skew brace.

```
gap> br := SmallBrace(8,18);;
gap> IsLeftNilpotent(br);
true
gap> IsRightNilpotent(br);
false
gap> Length(LeftNilpotentIdeals(br));
3
gap> Length(RightNilpotentIdeals(br));
2
```

4.3.8 SmoktunowiczSeries (for IsSkewbrace, IsInt)

▷ SmoktunowiczSeries(obj, bound)

(operation)

Returns: a list of bound left ideals of the Smoktunowicz's series of obj

The Smoktunowicz's series of a skew brace A is defined recursively as $A^{[1]} = A$ and $A^{[n+1]}$ is the additive subgroup of A generated by $A^{[i]} * A^{[n+1-i]}$ for $1 \le i+j \le n+1$, where $a*b = \lambda_a(b) - b$.

4.3.9 Socle (for IsSkewbrace)

⊳ Socle(*obj*)

(attribute)

Returns: the socle of obj

The socle of a skew brace A is the ideal ker $\lambda \cap Z(A, +)$.

```
gap> Socle(SmallSkewbrace(6,2));
<ideal in <skew brace of size 6>, (size 1)>
gap> Socle(SmallBrace(8,20));
<ideal in <brace of size 8>, (size 8)>
gap> Socle(SmallBrace(8,2));
<ideal in <brace of size 8>, (size 4)>
```

4.3.10 Annihilator (for IsSkewbrace)

▷ Annihilator(obj)
(attribute)

Returns: the annihilator of *obj*

The socle of a skew brace *A* is the ideal ker $\lambda \cap Z(A, +) \cap Z(A, \circ)$.

```
Example

gap> Annihilator(SmallSkewbrace(8,12));

<ideal in <br/>
brace of size 8>, (size 2)>
gap> Annihilator(SmallSkewbrace(4,2));

<ideal in <skew brace of size 4>, (size 2)>
gap> Annihilator(SmallSkewbrace(8,14));

<ideal in <brace of size 8>, (size 4)>
```

4.4 Mutipermutation skew braces

4.4.1 SocleSeries (for IsSkewbrace)

```
▷ SocleSeries(obj) (operation)
```

Returns: the socle series of obj

The socle series of a skew brace A is defined recursively as $A_1 = A$ and $A_{n+1} = A_n/\operatorname{Soc}(A_n)$, see [SV18].

4.4.2 MultipermutationLevel (for IsSkewbrace)

▷ MultipermutationLevel(obj)

(attribute)

Returns: the multipermutation level of the skew brace obj

The multipermutation level of a skew brace A is defined as the smallest positive integer n such that the n-th term A_n of the socle series has only one element, see Definition 5.17 of [SV18].

```
gap> br := SmallBrace(8,20);;
gap> SocleSeries(br);
[ <brace of size 8>, <brace of size 1> ]
gap> MultipermutationLevel(br);
2
```

4.4.3 IsMultipermutation (for IsSkewbrace)

▷ IsMultipermutation(obj)

(property)

Returns: true if the skew brace obj has finite multipermutation level and false otherwise

4.4.4 Fix (for IsSkewbrace)

 \triangleright Fix(obj) (attribute)

Returns: the left ideal $\{x \in A : \lambda_a(x) = x \ \forall a \in A\}$ of the skew brace A.

```
gap> br := SmallSkewbrace(6,1);;
gap> IsTrivialSkewbrace(br);
true
gap> Fix(br);
```

```
[ <()>, <(1,2,3)(4,5,6)>, <(1,3,2)(4,6,5)>, <(1,4)(2,6)(3,5)>, <(1,5)(2,4)(3,6)>, <(1,6)(2,5)(3,4)> ]
```

4.4.5 KernelOfLambda (for IsSkewbrace)

▷ KernelOfLambda(obj)

(attribute)

Returns: the kernel of the map λ as a subset of elements of the skew brace obj.

```
gap> br := SmallBrace(6,1);;
gap> KernelOfLambda(br);
[ <()>, <(1,2,3)(4,5,6)>, <(1,3,2)(4,6,5)> ]
```

4.4.6 Quotient (for IsSkewbrace, IsSkewbrace)

▷ Quotient(obj, ideal)

(operation)

Returns: the quotient obj by ideal

4.5 Prime and semiprime ideals

4.5.1 IsPrimeBrace (for IsSkewbrace)

▷ IsPrimeBrace(obj)

(property)

Returns: true if the skew brace obj is prime

A skew brace A is said to be prime if for all non-zero ideals I and J one has $I * J \neq 0$

```
gap> IsPrimeBrace(SmallBrace(24,12));
false
gap> IsPrimeBrace(SmallBrace(24,94));
true
```

4.5.2 IsPrimeIdeal (for IsSkewbrace and IsIdealInParent)

 \triangleright IsPrimeIdeal(obj)

(property)

Returns: true if the ideal obj is prime

An ideal I of a skew brace A is said to be prime if A/I is a prime skew brace.

```
gap> IsPrimeIdeal(last[2]);
true
```

4.5.3 PrimeIdeals (for IsSkewbrace)

▷ PrimeIdeals(obj)
(attribute)

Returns: the list of prime ideals of the skew brace obj

```
gap> Length(PrimeIdeals(SmallBrace(24,94)));
2
```

4.5.4 IsSemiprime (for IsSkewbrace)

▷ IsSemiprime(obj)

(attribute)

Returns: true if the skew brace obj is semiprime

An ideal I of a skew brace A is said to be semiprime if A/I is a semiprime skew brace.

```
gap> br := DirectProductSkewbraces(SmallSkewbrace(12,22),SmallSkewbrace(12,22));;
gap> IsSemiprime(br);
true
```

4.5.5 IsSemiprimeIdeal (for IsSkewbrace and IsIdealInParent)

▷ IsSemiprimeIdeal(obj)

(attribute)

Returns: true if the ideal obj is semiprime

```
Example

gap> SemiprimeIdeals(SmallSkewbrace(12,24));
[ <ideal in <skew brace of size 12>, (size 12)> ]

gap> IsSemiprimeIdeal(last[1]);

true
```

4.5.6 SemiprimeIdeals (for IsSkewbrace)

▷ SemiprimeIdeals(obj)

(attribute)

Returns: the list of semiprime ideals of the skew brace obj

```
gap> SemiprimeIdeals(SmallSkewbrace(12,24));
[ <ideal in <skew brace of size 12>, (size 12)> ]
gap> Length(SemiprimeIdeals(SmallSkewbrace(12,22)));
2
```

4.5.7 BaerRadical (for IsSkewbrace)

▷ BaerRadical(obj)

(attribute)

Returns: the Baer radical of the skew brace *obj*

```
gap> br := SmallSkewbrace(6,2);;
gap> BaerRadical(br);
<ideal in <skew brace of size 6>, (size 6)>
```

4.5.8 IsBaer (for IsSkewbrace)

```
\triangleright IsBaer(obj) (property)
```

Returns: true if the skew brace obj is ia Baer radical skew brace.

A skew brace A is said to be Baer radical if A = B(A), where B(A) is the Baer radical of A (i.e., the intersection of all prime ideals of A).

```
gap> br := SmallSkewbrace(6,2);;
gap> IsBaer(br);
true
Example

true
```

4.5.9 WedderburnRadical (for IsSkewbrace)

▷ WedderburnRadical(obj)

(attribute)

Returns: the Wedderburn radical of the skew brace obj

The Wedderburn radical of a skew brace is the intersection of all its prime ideals

```
gap> br := SmallSkewbrace(6,2);;
gap> WedderburnRadical(br);
<ideal in <skew brace of size 6>, (size 3)>
```

4.5.10 SolvableSeries (for IsSkewbrace)

▷ SolvableSeries(obj)

(attribute)

Returns: a list with the solvable series of the skew brace obj

The solvable series of a skew brace A is defined recursively as $A_1 = A$ and $A_{n+1} = A_n * A_n$ for $n \ge 1$, where $a * b = \lambda_a(b) - b$

```
gap> br := SmallSkewbrace(8,20);;
gap> IsSolvable(br);
true
gap> SolvableSeries(br);
[ <skew brace of size 8>, <brace of size 2>, <brace of size 1> ]
gap> br := SmallSkewbrace(12,23);;
gap> IsSolvable(br);
false
```

4.5.11 IsMinimalIdeal (for IsSkewbrace and IsIdealInParent)

▷ IsMinimalIdeal(obj, ideal)

(property)

Returns: true if ideal is a minimal ideal of obj An ideal I of A is said to be minimal if does not contain any other ideal of A. To check if an ideal I of A is minimal, one computes the ideals of I and keep only those that are simple as a skew brace.

4.5.12 MinimalIdeals (for IsSkewbrace)

▷ MinimalIdeals(obj)

(attribute)

Returns: a list of minimal ideals of the skew brace obj
